Btech CSE 2025-2029

**Subject: Scratch Programming**

**Volcanic Eruption**

# Introduction to case study

“This project simulates a volcanic eruption using Scratch. It visually demonstrates how magma builds up, pressure increases, and lava, smoke, and gases are released during an eruption.”

# Case study flow

**Backdrop:** Volcano

**Sprites:**

- Magma (rising animation)
- Smoke (rising and fading)
- Explosion/starburst
- Text / narration

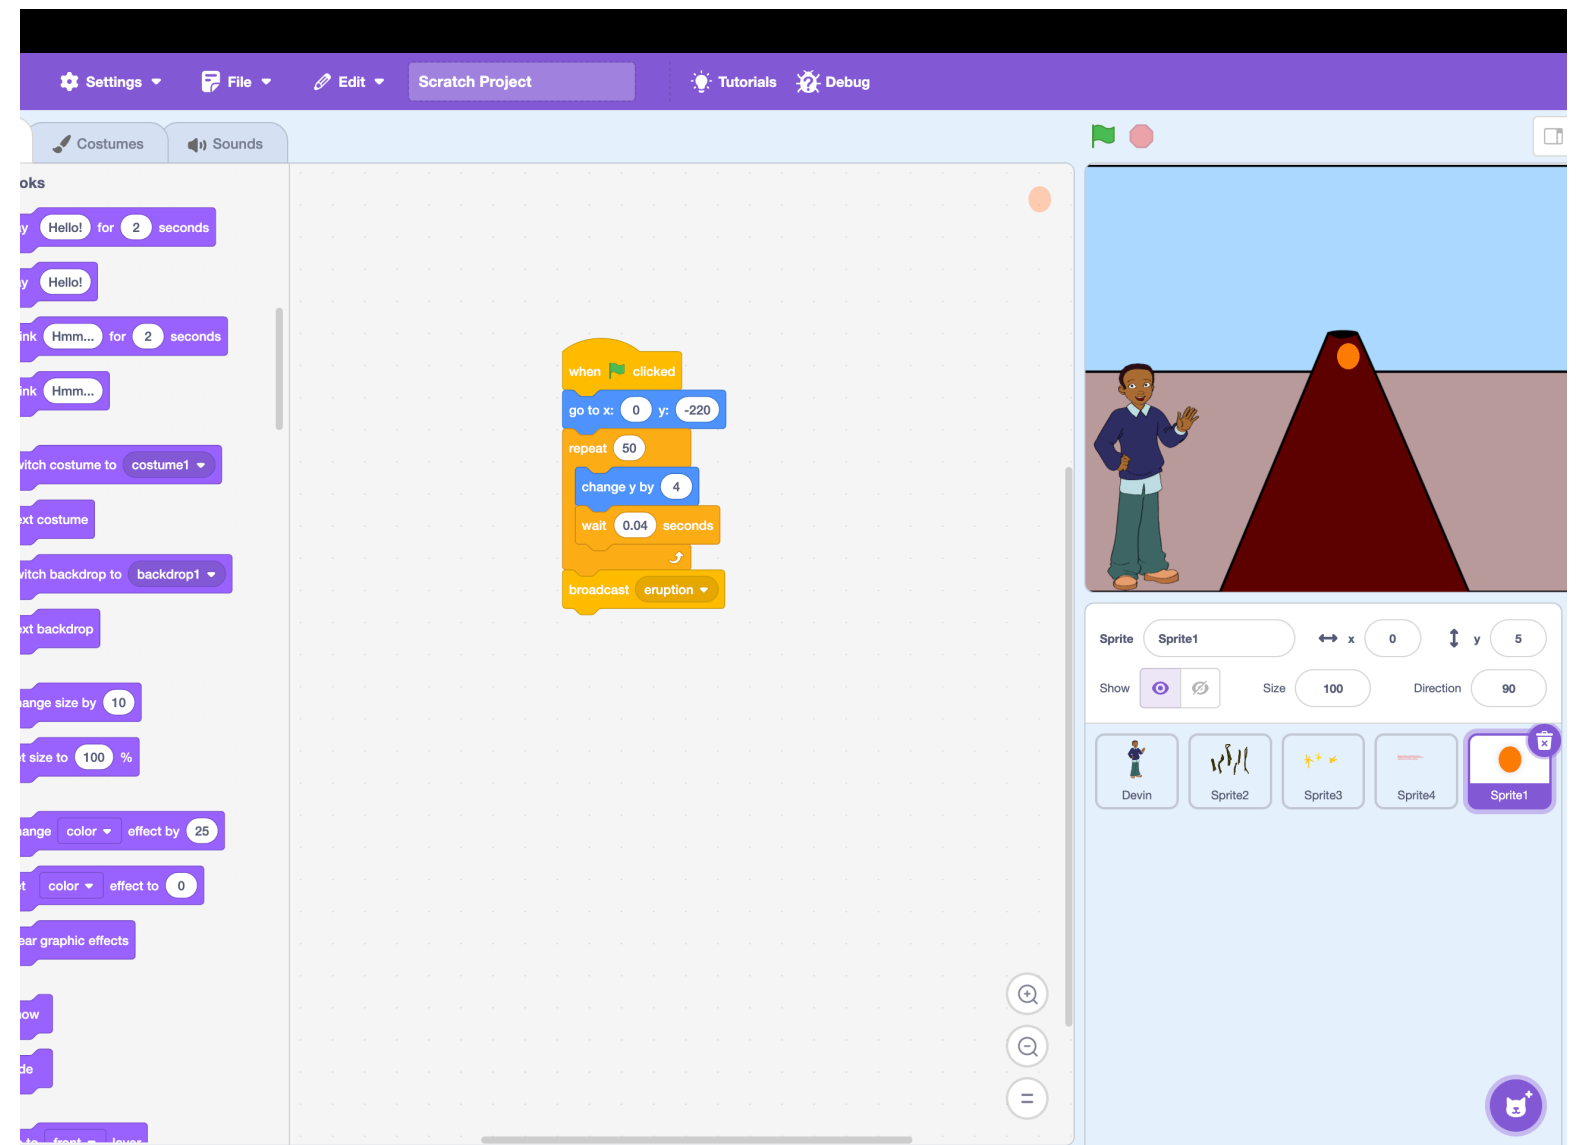

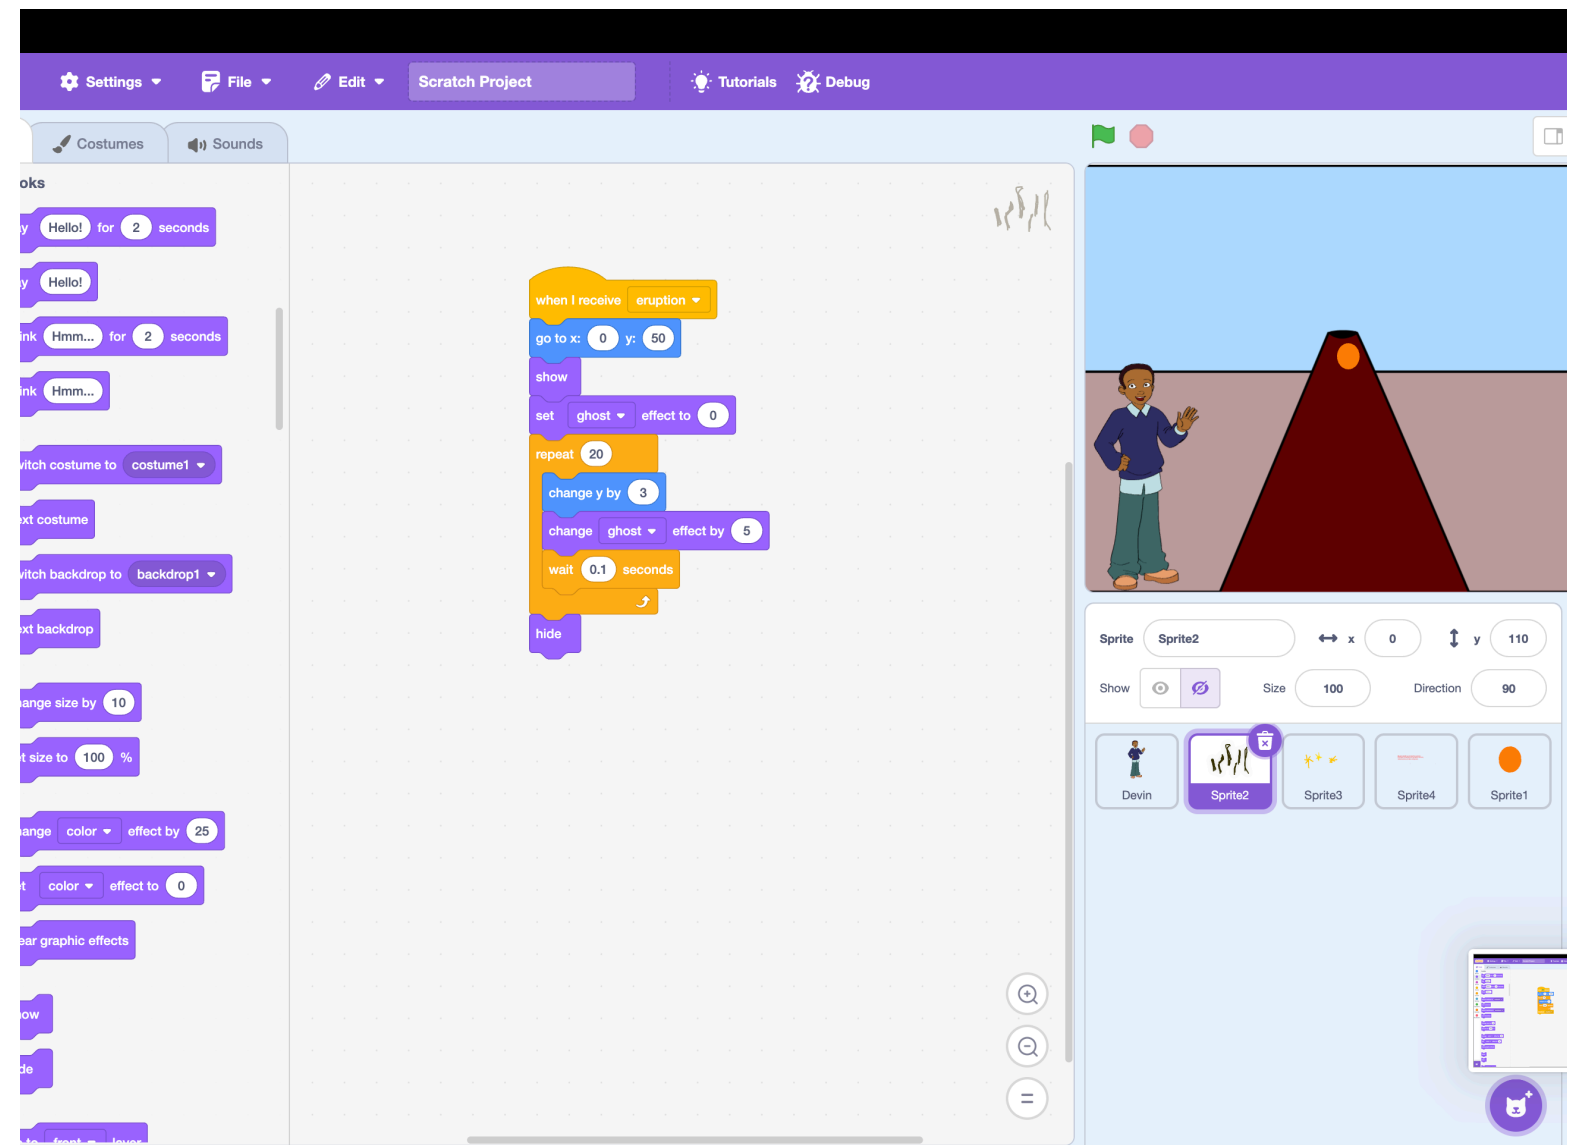

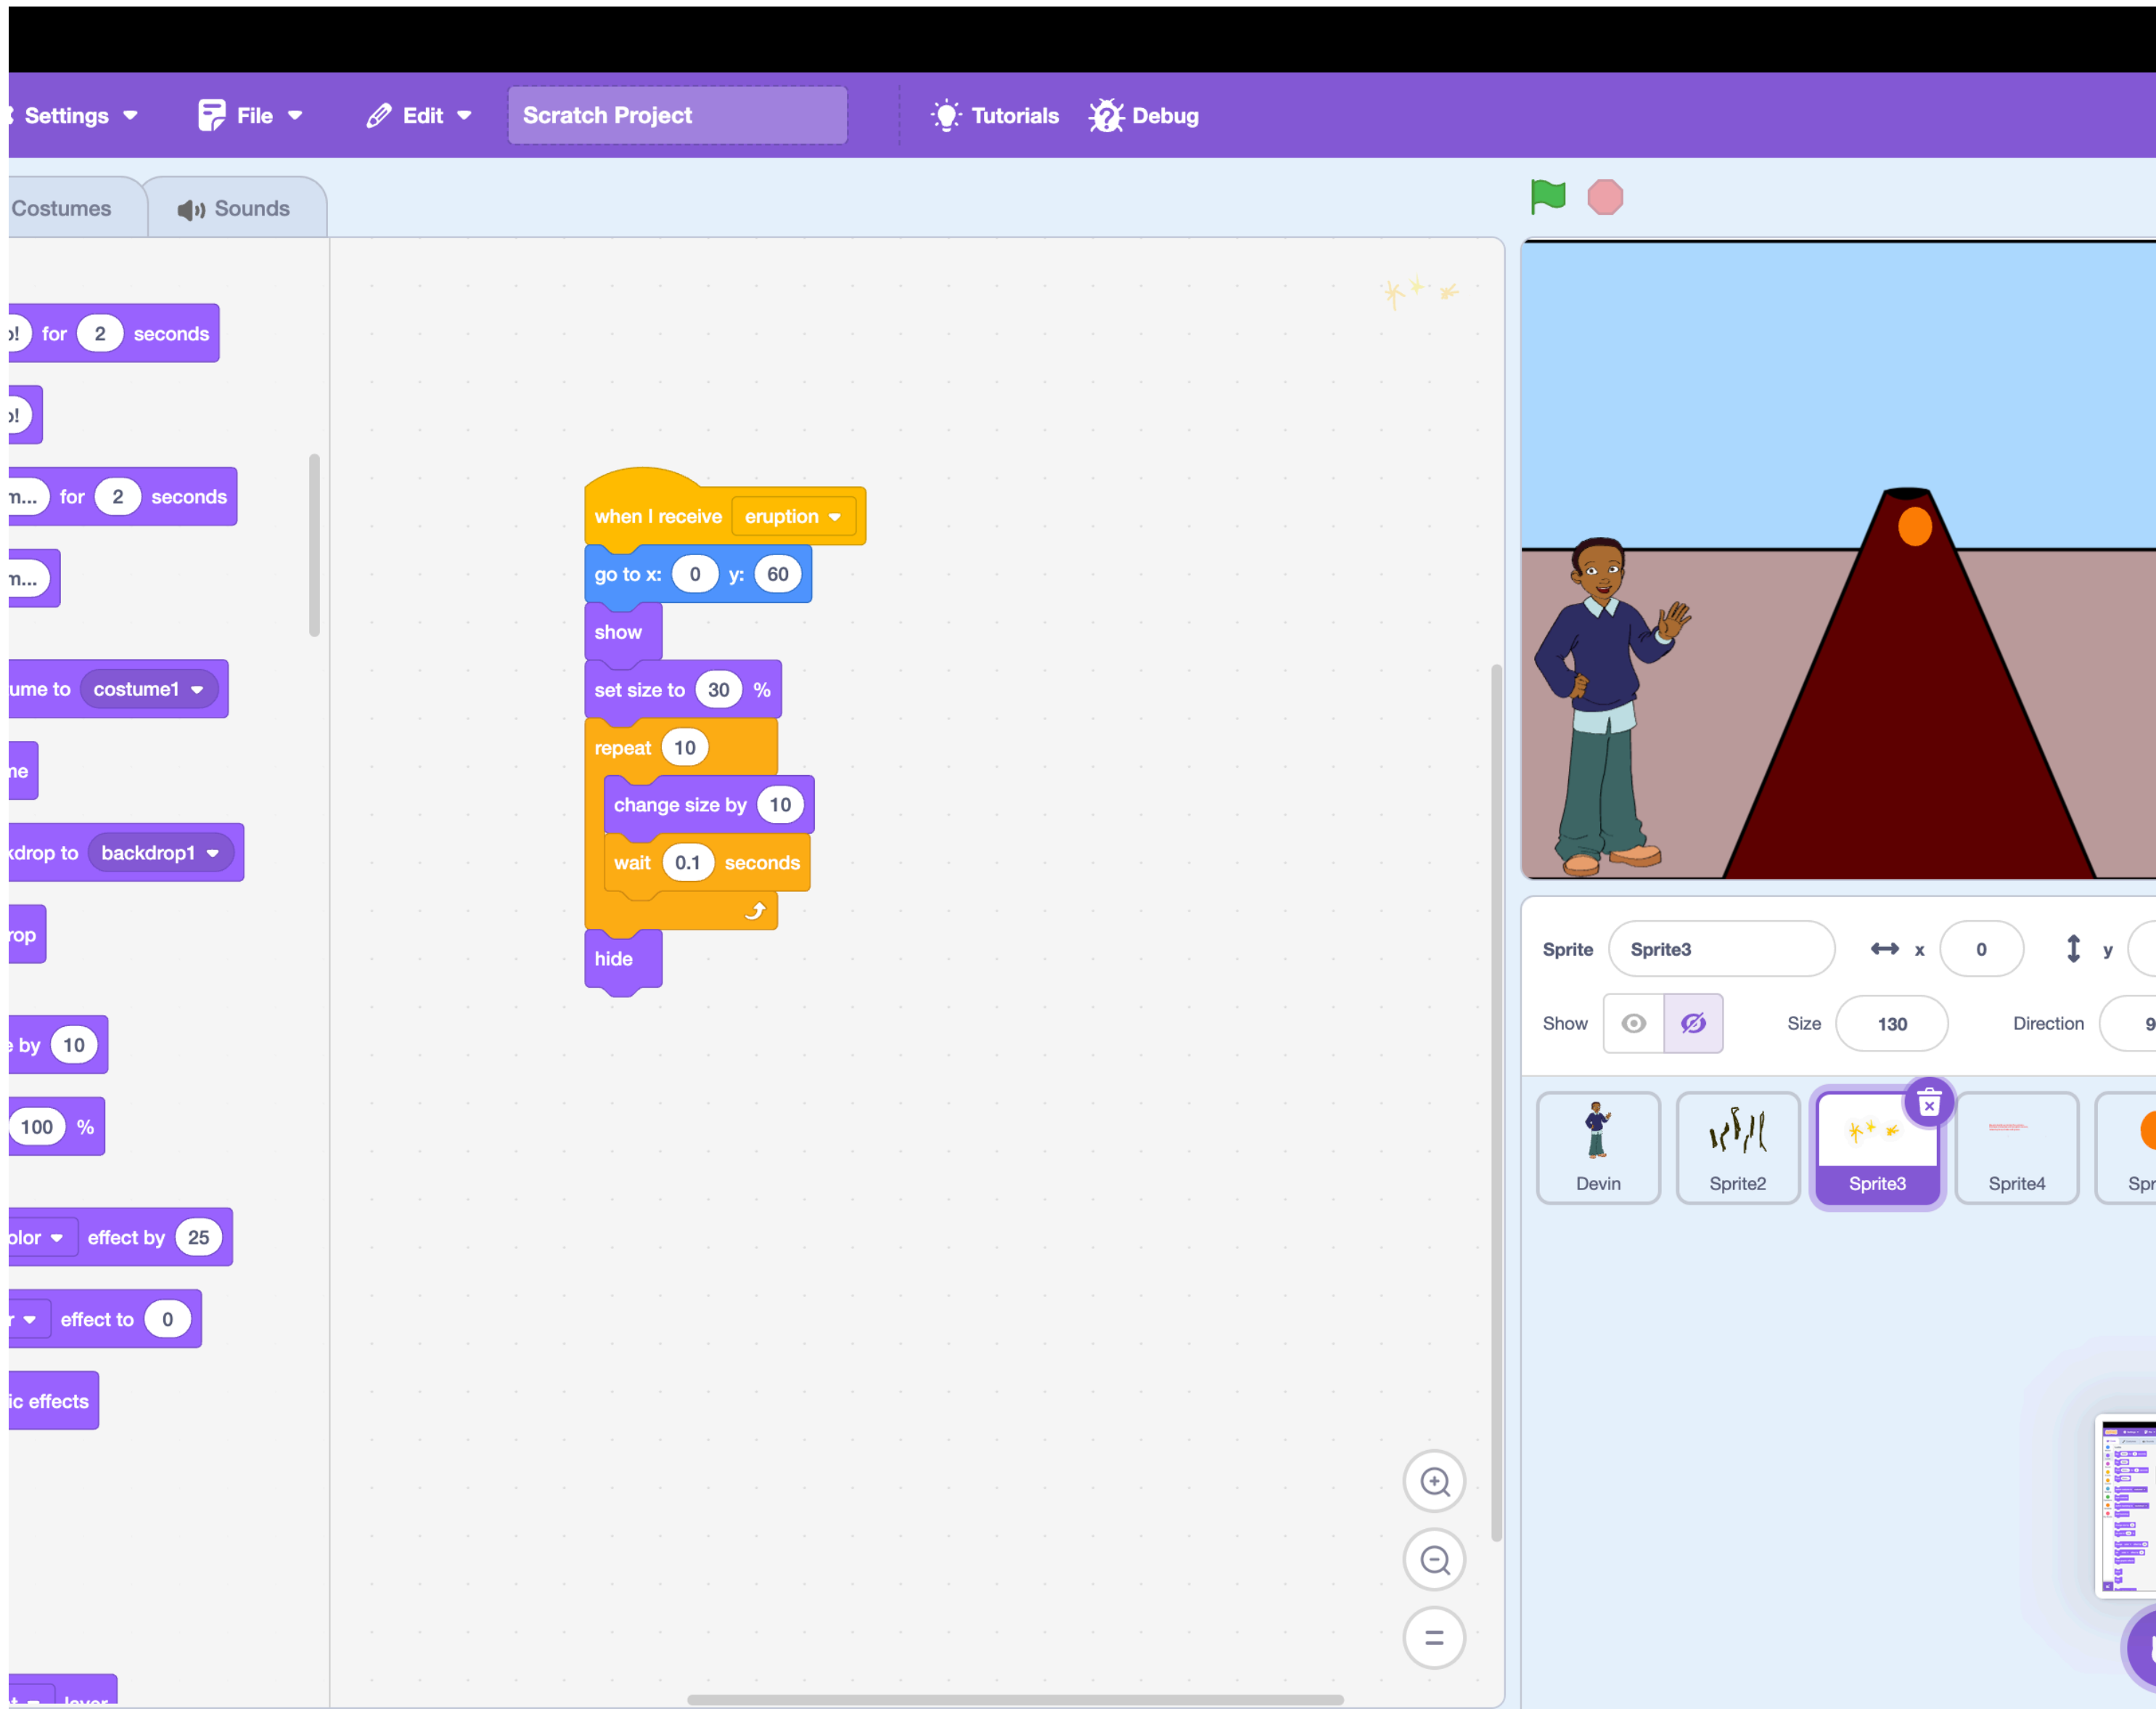

**Animation Sequence:** Magma → Explosion → Smoke

**Text/Narration:** Line-by-line educational explanation synced with animation

# METHODS /ALGORITHM APPLIED

1. **Broadcasts:** "eruption" triggers explosion, smoke, and text
2. **Loops:** repeat blocks for smooth magma rising and smoke animation
3. **Wait blocks:** synchronize text with narration
4. **Scratch technology applied:** animation, sounds, sprite coordination

## RESULTS & CONCLUSION

The scratch based volcanic eruption was successfully implemented.

The project visually demonstrates the complete eruption process, starting from magma buildup, followed by pressure increase, and finally eruption with lava, smoke, and gases.

Educational text and audio narration appear at correct stages of the eruption, making the learning process clear and easy to understand.

Project combines animations, educational text & narration using scratch to understand a natural phenomena in simple way
